Veri-SEAL: Detect Product in Seal Problems

Jenton Dimaco label and data verification systems are used to detect and prevent mis-labelling or the use of the wrong packaging materials. They prevent rejection, repackaging and worst, expensive returns and recalls from customers. The systems check that the artwork is correct and that all pre-printed and over-printed data is also correct such as barcodes, price, weight and allergens.

Veri-PACK systems can now be used to detect product in seal on thermoformed and top sealed packs. Veri-SEAL is an optional add-on that allows real-time detection and rejection of packs with seal contamination.

Veri-SEAL:
## Seal Contamination Detection

Verifies:

- Seal integrity
- Product contamination in seal
- Product attached to outside edge of pack
- Significant top film creasing
- Poor top film cutting

The benefits:

- Reduces risk of pack leakages
- Ensures MAP fill is maintained
- Significant QA labour savings
- Prevents poor quality packs reaching supermarket / consumer
- Minimises food waste
- Allows repacking in high-care
- Fully auditable using Veri-CENTRAL

Checks for seal contamination on every pack
